

## Trends in Olympia

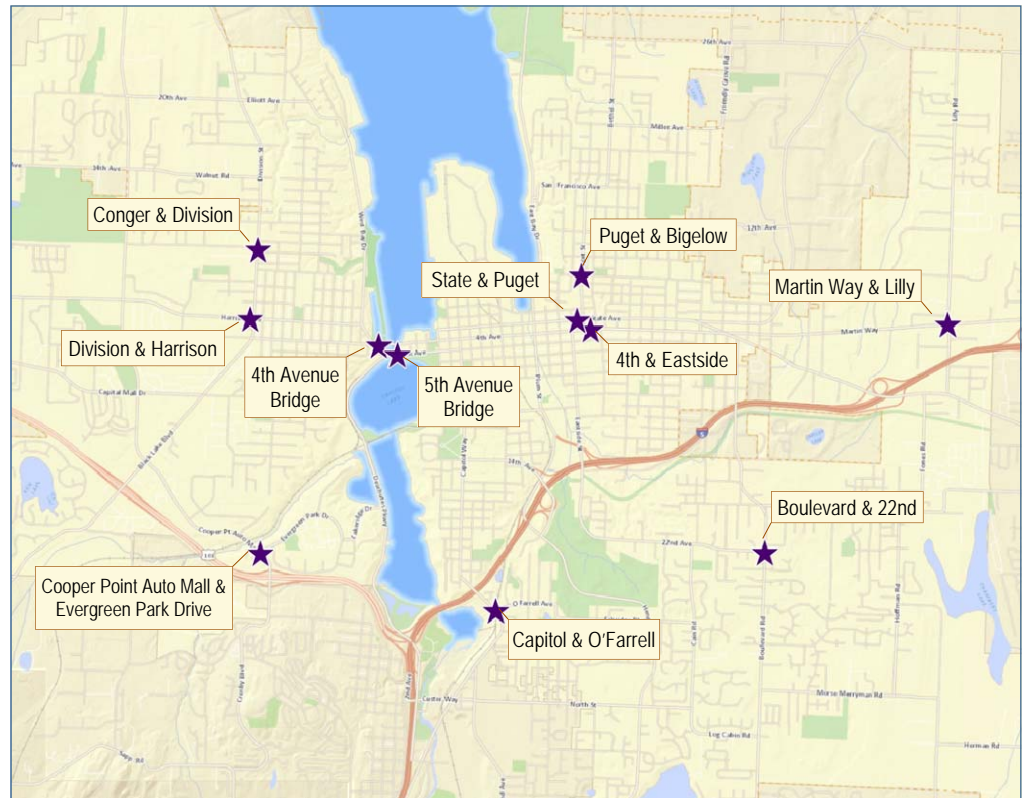

Each year, staff collects data on bicycle, pedestrian, transit and vehicle use in 11 locations throughout the City.

This information is used to monitor the growth in walking, biking and transit use relative to vehicle use.

The data is a snap shot of mode use at each location. Mode use is expected to change as land use densities increase and network improvements (such as sidewalks) are made.

Pedestrian, bike and vehicle counts are the total of three, two-hour peak period counts on one day in March. Transit is the average daily ridership on one or more routes passing through that point in March.

The adjacent graph provides totals for all locations from 2009 through 2014.
